

INTERNAL MEMO • MARKETING & SALES OPERATIONS

PREPARED FOR PATEL PROCESSING LEADERSHIP • JULY 2026

One system for every lead we generate.

A recommendation to adopt HubSpot as the shared system of record connecting marketing campaigns to sales conversion — across RetailzPOS, Moolah Points, and PtechPOS.

THE PROBLEM

We can't currently see the line between ad spend and revenue.

Three products, three separate motions. Marketing runs campaigns for RetailzPOS, Moolah Points, and PtechPOS, and today there's no single record of which campaign actually produced a paying customer — only which one produced a click.

Leads don't become anything actionable on their own. A conversion on a tagged landing page doesn't automatically turn into something sales can act on — it sits until someone manually reviews and forwards it, and the campaign data that explains where it came from often doesn't travel with it.

Sales has no consistent way to triage. Reps have no reliable signal for which inbound leads are worth calling first, so real selling time goes into manual sorting instead.

We can't answer the one question that matters most. "What did it cost us to acquire our last ten customers, and which campaign brought them in" currently requires stitching together ad-platform exports by hand.

This is a systems problem, not a headcount or a talent problem — and it has a specific, well-understood fix.

THE ASK

Adopt one CRM, shared by marketing and sales, across all three products.

We're recommending **HubSpot** — starting on the Starter tier — as the single system that captures a lead the moment they convert from a tagged campaign, automatically flags it as marketing-qualified once it meets our criteria, hands it to a sales rep in real time with full campaign

context attached, and reports the resulting numbers back to both teams in one dashboard.

THE MECHANISM

From a tagged click to a rep's queue, automatically.

No manual forwarding, no lost campaign data, no lag between "this person is interested" and "someone is calling them."

WHAT CHANGES

Marketing, sales, and leadership working off the same record.

attribution happen automatically, not by hand

- MQL becomes a real, shared definition — not a spreadsheet argument with sales
- Visibility into what happens to a lead after it's handed off, not just at the point of capture

not raw and unsorted

- Full context — source campaign, product line, on-site behavior — before the first call
- One queue, real-time notification, no shared inbox to monitor

lead, cost per MQL, and conversion rate

- Answers broken out by product line — RetailzPOS, Moolah Points, PtechPOS
- No more waiting on a manual reporting cycle to know what's working

WHAT WE CAN FINALLY MEASURE

Four numbers we currently can't produce on demand.

Cost per Lead

By campaign, channel, and product line — not a blended, after-the-fact estimate.

Cost per MQL

The number that tells us whether a campaign is producing real interest, not just clicks.

MQL → SQL Conversion Rate

Where the marketing-to-sales handoff is actually working, and where it isn't.

Cost per Customer

The number that actually justifies — or kills — a campaign's budget.

We don't have a baseline for any of these today. Phase 1 (below) exists specifically to establish one, so future budget conversations run on real numbers instead of estimates.

WHY THIS TOOL

We compared three real options. This is the one where the mechanism is native, not hand-built.

CAPABILITY	HUBSPOT	ZOHO CRM	FRESHSALES
UTM capture	Native	Native	Native
MQL as a system concept	Native lifecycle stage	Build your own	Native lead scoring
Real-time sales handoff	Native workflow	Native workflow	Native workflow
Entry price	~\$15–20/seat/mo	\$14–23/user/mo	~\$11–47/user/mo
Ad-platform integration	Native (deeper at Pro)	Third-party connector	Native (Google), connector (Meta)

Full comparison, pricing sources, and integration detail in the earlier CRM Recommendation memo (crm-recommendation-ads-marketing-sales-2026-07.md). HubSpot is the only option where the MQL-to-handoff mechanism above is a built-in concept rather than something we'd construct and maintain ourselves.

THE INVESTMENT

A modest starting cost, with a clear, optional upgrade path.

PHASE 1

HubSpot Starter

Marketing Hub, Sales Hub, and Service Hub Starter bundled.
Covers UTM capture, the MQL lifecycle stage, and real-time sales notifications — everything the pilot needs.

\$15–20 / seat / mo

PHASE 2 • LATER

Marketing Hub Professional

Only once we know which campaigns are working and want to sync audiences and conversions directly back to Google and Meta.

\$800–890 / mo + \$3,000 onboarding

We are not asking to approve Phase 2 today. We're asking to approve Phase 1, prove the mechanism, and bring the case for Phase 2 back with real cost-per-MQL and cost-per-customer numbers behind it.

THE ROLLOUT

Three phases, twelve weeks to a real answer.

01

Pilot

WEEKS 1–4

Stand up HubSpot Starter. Connect one product line's ad campaigns — starting with RetailzPOS, our most established paid channel. Define MQL criteria with marketing and sales together, and wire the handoff workflow.

02

Expand

WEEKS 5–8

Bring Moolah Points and PtechPOS onto the same instance, separated by pipeline. Train sales on the new queue and notification flow.

03

Evaluate

WEEK 12+

Review real cost-per-MQL and cost-per-customer data from the pilot. Decide, with actual numbers in hand, whether Phase 2's ad-platform feedback loop is worth the upgrade.

THE RECOMMENDATION

Approve Phase 1. Let the data make the case for Phase 2.

The Starter-tier cost is modest against what we already spend on campaigns without matching visibility into what they're actually producing. The ask today is budget approval for Phase 1 and a named owner to lead the HubSpot setup — not a twelve-month commitment to the full platform.
